

American scientists have found the cause of baldness

A group of American researchers claims that she was able to establish the cause of baldness. According to the results of research conducted by scientists, the report of which was published in the Journal of Clinical Investigation, the case is not the lack of new hair. As found by researchers in patients suffering from alopecia is formed the same number of hair roots as well as in healthy people. However, due to a defect in stem cell new hair are so small that they can only be seen under a microscope according to NEWSru.co.il with reference to the broadcasting Corporation BBC. According to the head of the research group of George Kostarelis this suggests the existence of problems with the activation of stem cells that transformerait progenitor cells with hair loss. Scientists hope that further research in this direction will allow to create a special cream which will be able to transform stem cells that will lead to the appearance of normal hair. The fact that the baldness is present the same number of stem cells gives hope for their reactivation notes, Kostarelis.
